ART UNIT	PAPER NUMBER
3677	

MAIL DATE	DELIVERY MODE
09/14/2009	PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

	Application No.	Applicant(s)
Office Action Summary	10/598,801	MATSUMURA ET AL.
	Examiner	Art Unit	
	DAVID C. REESE	3677	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE <u>3</u> MONTH(S) OR THIRTY (30) DAYS,
WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.
- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed
  after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
  Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any
  earned patent term adjustment. See 37 CFR 1.704(b).

Status

1) ☒ Responsive to communication(s) filed on *14 May 2009*.

2a) ☒ This action is **FINAL**.   2b) ☐ This action is non-final.

3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is
closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4) ☒ Claim(s) *1-18* is/are pending in the application.

　　4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5) ☐ Claim(s) _____ is/are allowed.

6) ☒ Claim(s) *1-18* is/are rejected.

7) ☐ Claim(s) _____ is/are objected to.

8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9) ☐ The specification is objected to by the Examiner.

10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.

　　Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

　　Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

　　a) ☐ All b) ☐ Some * c) ☐ None of:

　　　1. ☐ Certified copies of the priority documents have been received.

　　　2. ☐ Certified copies of the priority documents have been received in Application No. _____.

　　　3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage

　　　　application from the International Bureau (PCT Rule 17.2(a)).

　　* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

1) ☐ Notice of References Cited (PTO-892)

2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)

3) ☐ Information Disclosure Statement(s) (PTO/SB/08)

6) ☐ Other: _____.

DETAILED ACTION

THIS FINAL ACTION IS RESPONSIVE TO THE AMENDMENT FILED 5/14/2009.

- Claims 15-18 were added.
- Claims 1, 6, and 10 were amended.
- Claims 1-18 are pending.

Claim Objections

[1]   Claim(s) were previously objected to because of informalities. Applicant has

successfully addressed these issues in the amendment filed on 5/14/2009. Accordingly, the

objection(s) to the claim(s) have been withdrawn.

Claim Rejections - 35 USC § 103

[2]   The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all

obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or
> described as set forth in section 102 of this title, if the differences between the subject
> matter sought to be patented and the prior art are such that the subject matter as a whole
> would have been obvious at the time the invention was made to a person having ordinary
> skill in the art to which said subject matter pertains. Patentability shall not be negatived
> by the manner in which the invention was made.

[3]   Claims 1-5, 7-9 and 11-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over

Itzkowitz (US 5,713,219 A) in view of Kedem et al. (US 2005/0115275 A1).

Itzkowitz discloses an oval-cut diamond (10c,10d) comprising a columnar girdle

(24c,24d), a crown provided above the girdle and having an octagonal table facet (12c, 12d) on a

top of the crown and a pavilion provided below the girdle (Figs. 2c,2d,3c,3d, 4c and 4d). The

girdle has an upper ridge between the crown and the girdle, a lower ridge between the pavilion

and the girdle and a contour line of a girdle cross-section, parallel to the table facet, being in an

oval or oval-like shape (Figs. 2c,2d,3c,3d,4c and 4d). The diamond has a central plane, a straight

central axis and eight-dividing planes (Figs. 2c,2d,3c,3d,4c and 4d). The central plane contains a

long axis (running along the long side of the diamond) of the contour line and being a plane

vertical to the table facet (Figs. 2c,3c, 3d,4c and 4d). The straight central axis crosses

vertically the table facet on the central plane (Figs. 2c,2d,3c,3d,4c and 4d). The eight-dividing

planes are composed of the central plane, a plane containing a short axis of the contour line of

the girdle cross-section and the central axis and planes dividing an angle around the central axis

between the plane containing the short axis and the central axis and the central plane equally into

two (Figs. 2c,2d,3c,3d,4c and 4d). The table facet has two opposite vertexes on the central plane

and six vertexes symmetrical with respect to the central plane (Figs. 2c, 2d,3c,3d,4c and 4d).

The crown has eight tetragonal crown main facets (18c that is between star face and upper girdle

facet), eight triangular star facets (having one side shared with the table) and sixteen upper girdle

facets (18c that has one side shared with the girdle) on a diamond circumference between the

girdle upper ridge and the table facet. Each of the crown main facets is a tetragon having two

opposite vertexes composed of a point, at which each of the eight-dividing planes crosses the

girdle upper ridge and each vertex of the table facet, and other vertexes each owned jointly with

each of two other crown main facets neighboring on the crown main facet (Figs. 2c,2d, 4c and

4d). Each of the star facets is a triangle having a bottom side coinciding with each side of the

table facet and an opposite vertex coinciding with each of the other vertexes jointly owned by

two neighboring crown main facets each having a vertex at each end of the bottom side (Figs.

2c,2d,4c and 4d). Each of the upper girdle facets is a triangle or an oval sector having a bottom

side coinciding with a side, whose end is on the girdle upper ridge, among sides of the crown

main facets and a vertex on the girdle upper ridge (Figs. 2c,2d,4c and 4d). The pavilion has a

bottom apex (22c,22d) at a lower end of the central axis and eight pavilion main facets

(extending from 22c or 22d) and sixteen lower girdle facets (16c,16d) on the diamond

circumference between the bottom apex and the girdle lower ridge (Figs. 3c,3d,4c and 4d). Each

of the pavilion main facets is a tetragon or a part of a tetragon extending from the bottom apex

toward a crossing point of each of the eight-dividing planes with the girdle lower ridge on the

diamond circumference between the bottom apex and the girdle lower ridge, and having a side,

whose end coincides with the bottom apex, jointly owned with each of two other pavilion main

facets neighboring on the pavilion main facet (Figs. 3c,3d,4c and 4d). Each of at least seven

pavilion main facets among the pavilion main facets is formed with opposite vertexes composed

of a crossing point of each of the eight-dividing planes with the girdle and the bottom apex (Figs.

2c,2d,3c,3d,4c and 4d). Each of the lower girdle facets formed between the pavilion main facets

and the girdle lower ridge is a triangle or an oval sector having a bottom side coinciding with a

side having an end on the girdle lower ridge among sides of each of the pavilion main facets and

a vertex on the girdle lower ridge (Figs. 3c,3d, 4c and 4d). Each of the lower girdle facets is

disposed on each of both sides of each of the pavilion main facets (Figs. 2c,2d,3c,3d, 4c and 4d).

The oval or oval-like shape formed by the contour line of the girdle cross-section has a ratio of a

short radius to a long radius, b/a, of 0.6 or more, in which a radius in a long axis direction of the

shape is denoted as "a", and a radius in a short axis direction of the shape is denoted as "b" (Figs.

2c,2d,3c and 3d). Each pair of four pairs of pavilion main facets, of which each pair is composed

of two pavilion main facets positioned opposite to each other with respect to the central axis, has

two crown main facets facing the two pavilion main facets through the girdle, and the two

pavilion main facets, the two crown main facets and the table facet have a common plane vertical

to all of them within them (Figs. 2c,2d,3c,3d,4c and 4d).

Itzkowitz fails to discloses that a circumscribed circle having a center on the central axis

and circumscribing the contour line at an end of the long axis and that each of at least seven

pavilion main facets among the pavilion main facets is formed with opposite vertexes composed

of a crossing point of each of the eight-dividing planes with the circumscribed circle and the

bottom apex. However, Kedem et al. teaches a diamond comprising a columnar girdle (52), a

crown (50) provided above the girdle and having an octagonal table facet (55) on a top of the

crown and a pavilion (70) provided below the girdle (Figs. 7-18). The girdle has an upper ridge

between the crown and the girdle, a lower ridge between the pavilion and the girdle and a

contour line of a girdle cross-section, parallel to the table facet, being in a square or square-like

shape (Figs. 11 and 12). The diamond has a central plane, a straight central axis (running

through 69), a circumscribed circle (103) and eight-dividing planes (105,106,107,108) (Figs. 7-

18). The central plane contains an axis (running between opposite sides of the diamond) of the

contour line and being a plane vertical to the table facet (Figs. 7-18). The straight central axis

crosses vertically the table facet on the central plane (Figs. 7-18). The circumscribed circle (103)

has a center (at culet) on the central axis and circumscribing the contour line at an end of an axis

(Figs. 8-10). The circumscribed circle provides enhanced brilliance and fire, as well as

appearance of a table reflection (Paragraph 0068). The eight-dividing planes are composed of

the central plane, a plane containing another axis of the contour line of the girdle cross-section

and the central axis and planes dividing an angle around the central axis between the plane

containing the another axis and the central axis and the central plane equally into two (Figs. 7-

18). The table facet has two opposite vertexes on the central plane and six vertexes symmetrical

with respect to the central plane (Figs. 7-18). The crown has eight tetragonal crown main facets

(58), eight triangular star facets (21) and sixteen upper girdle facets (60,61,62,63,64,65,66,67) on

a diamond circumference between the girdle upper ridge and the table facet. Each of the crown

main facets is a tetragon having two opposite vertexes composed of a point, at which each of the

eight-dividing planes crosses the girdle upper ridge and each vertex of the table facet, and other

vertexes each owned jointly with each of two other crown main facets neighboring on the crown

main facet (Figs. 7 and 10). Each of the star facets is a triangle having a bottom side coinciding

with each side of the table facet and an opposite vertex coinciding with each of the other vertexes

jointly owned by two neighboring crown main facets each having a vertex at each end of the

bottom side (Figs. 7 and 10). Each of the upper girdle facets is a triangle or an oval sector

having a bottom side coinciding with a side, whose end is on the girdle upper ridge, among sides

of the crown main facets and a vertex on the girdle upper ridge (Figs. 7 and 10). The pavilion

has a bottom apex (69) at a lower end of the central axis and eight pavilion main facets

(90,91,92,93,94,95,96,97) and sixteen lower girdle facets (76,77,78,79,80,81,82,83) on the

diamond perimeter between the bottom apex and the girdle lower ridge (Figs. 8-10). Each of the

pavilion main facets is a tetragon or a part of a tetragon extending from the bottom apex toward a

crossing point of each of the eight-dividing planes with the girdle lower ridge on the diamond

perimeter between the bottom apex and the girdle lower ridge, and having a side, whose end

coincides with the bottom apex, jointly owned with each of two other pavilion main facets

neighboring on the pavilion main facet (Figs. 8-10). Each of at least seven pavilion main facets

among the pavilion main facets is formed with opposite vertexes composed of a crossing point of

each of the eight-dividing planes with the circumscribed circle and the bottom apex (Figs. 9 and

10). Each of the lower girdle facets formed between the pavilion main facets and the girdle

lower ridge is a triangle or an oval sector having a bottom side coinciding with a side having an

end on the girdle lower ridge among sides of each of the pavilion main facets and a vertex on the

girdle lower ridge (Figs. 8-10). Each of the lower girdle facets is disposed on each of both sides

of each of the pavilion main facets (Figs. 8-10). Each pair of four pairs of pavilion main facets,

of which each pair is composed of two pavilion main facets positioned opposite to each other

with respect to the central axis, has two crown main facets facing the two pavilion main facets

through the girdle, and the two pavilion main facets, the two crown main facets and the table

facet have a common plane vertical to all of them within them (Figs. 10-12). Therefore, it would

have been obvious to one having ordinary skill in the art at the time the invention was made to

have the circumscribed circle having a center on the central axis and circumscribing the contour

line at an end of an axis and that each of at least seven pavilion main facets among the pavilion

main facets is formed with opposite vertexes composed of a crossing point of each of the eight-

dividing planes with the circumscribed circle and the bottom apex as taught by Kedem et al. in

the diamond of Itzkowitz. Doing so, enhances the appearance of the diamond since the

circumscribed circle provides enhanced brilliance and fire, as well as appearance of a table

reflection.

From the combination of Itzkowitz and Kedem et al., Itzkowitz discloses that the central

axis is disposed in a center of the long axis of the contour line of the girdle cross-section and the

circumscribed circle in accordance with the teachings of Kedem et al. will circumscribe the

contour line at both ends of the long axis just like it circumscribes the contour line at the corners

of the diamond of Kedem et al.

Each of the pavilion main facets has opposite vertexes composed of a crossing point of

each of the eight-dividing planes with the circumscribed circle and the bottom apex as taught by

Kedem et al. in Figure 10.

Itzkowitz discloses that each of the pavilion main facets has a substantially equal pavilion

angle to the table facet (Figs. 2c,2d,3c,3d,4c and 4d).

A crown main facet as discloses by Itzkowitz that each of the pavilion main facets has the

substantially equal pavilion angle faces through the girdle has a substantially equal crown angle

to the table facet (Figs. 2c,2d,3c,3d,4c and 4d).

The girdle has a substantially equal girdle height around a whole circumference of the

girdle (Figs. 2c,2d,3c,3d,4c and 4d). Six pavilion main facets excluding two pavilion main facets

extending in a long axis direction from the bottom apex and lower girdle facets are disposed

between two neighboring pavilion main facets among the six pavilion main facets have adjusting

facets between a respective facet and the girdle lower ridge having a larger angle to the table

facet than the pavilion angle and forming a ridge between the respective facet and each of the

adjusting facets (Figs. 2c,2d,3c,3d, 4c and 4d).

From the combination of Itzkowitz and Kedem et al., Itzkowitz discloses at least seven

pavilion main facets have opposite vertexes composed of a crossing point of each of the eight-

dividing planes with the girdle and the bottom apex have a substantially equal pavilion angle to

the table facet (Figs. 2c,2d,3c,3d,4c and 4d) and when combined with the circumscribed circle

that is taught by Kedem et al. the opposite vertexes composed of a crossing point of each of the

eight-dividing planes with the circumscribed circle and the bottom apex will have a substantially

equal pavilion angle to the table facet. Especially since Kedem et al. also teaches that the

pavilion angles to the table facet for the pavilion main facets also have a substantially equal

pavilion angle to the table facet as seen in Figures 11 and 12.

The contour line of the girdle cross-section parallel to the table is oval (Figs. 2c,

2d,3c,3d,4c and 4d).

Itzkowitz and Kedem et al. fails to disclose that the contour line of the girdle cross-

section parallel to the table is in a shape of two oval sectors crossing each other or that the

contour line of the girdle cross-section parallel to the table is in a shape of three oval sectors

crossing each other.

With respect to this limitation as well as any other limitation found in the instant set of

claims that is held to not be shown expressly or explicitly disclosed or taught by either Itzkowitz,

Kedem et al. or the combination thereof, the examiner would like to reiterate that it would have

been obvious to one having ordinary skill in the art at the time of Applicant's invention to have

the contour line of the girdle cross-section parallel to the table is in a shape of two oval sectors

crossing each other or that the contour line of the girdle cross-section parallel to the table is in a

shape of three oval sectors crossing each other by providing a diamond in the shape of a

marquise cut or a pear cut; as well as any other alteration to the gemstone as provided below

since it is extremely old, well known, readily apparent and profoundly obvious to change the

size, shape, orientation, angles, percentages, planes, and create ranges for facets and the

gemstone in its entirely as to merely alter the aesthetics of said gemstone for the corresponding

and resulting properties including brilliance, radiance, etc. for the utility of mere user preference.

It is also extremely well known that altering said features will produce different properties

radiating from said gemstone, depending on the changes and alterations made. Therein, once

again, lies the pertinence behind such, as no unexpected result, viewed by one skilled in the art;

will occur, with any of the above possible changes or alterations to any given gemstone.

[5]   Claims 6, 10, and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over

Itzkowitz in view of Kedem et al. as applied to claims 4 and 9 above, and further in view of

Kawabuchi et al. (US 2003/0154741).

        Itzkowitz and Kedem et al. fail to discloses that a pavilion angle to the table facet each of

the pavilion main facets has and a crown angle to the table facet each of the crown main facets

has are in a region surrounded by lines connecting points (p, c): (43 degrees, 10 degrees), (41

degrees, 14 degrees), (37 degrees, 23 degrees), (35 degrees, 33 degrees), (35 degrees, 36

degrees), (37 degrees, 42 degrees), (39 degrees, 42 degrees), (41 degrees, 36 degrees), (43

degrees, 24 degrees) and (44.7 degrees, 9 degrees) on a graph drawn with pavilion angles (p) in a

vertical line and crown angles (c) in a horizontal line since Itzkowitz and Kedem et al. fail to

disclose the values for the crown angles and the pavilion angles or that the values can be view on

a graph. However, Kawabuchi et al. teaches that a cut design of diamonds (1) providing plenty

of visual-perceptible reflection. The diamond comprises a columnar girdle (12), a crown

(11,14,15,16) provided above the girdle and having an octagonal table facet (11) on a top of the

crown and a pavilion (13,17,18) provided below the girdle (Figs. 1A-1C). The girdle has an

upper ridge between the crown and the girdle, a lower ridge between the pavilion and the girdle

and a contour line of a girdle cross-section, parallel to the table facet, being in a circle or

circular-like shape (Figs. 1A-1C). The diamond has a central plane, a straight central axis (Z)

and eight-dividing planes (21) (Figs. 1A-1C). The central plane contains an axis of the contour

line and being a plane vertical to the table facet (Figs. 1A-1C). The straight central axis crosses

vertically the table facet on the central plane (Fig. 1B). Each of at least seven pavilion main

facets among the pavilion main facets is formed with opposite vertexes composed of a crossing

point of each of the eight-dividing planes with the girdle and the bottom apex (Figs. 9 and 10).

The eight-dividing planes are composed of the central plane, a plane containing another axis of

the contour line of the girdle cross-section and the central axis and planes dividing an angle

around the central axis between the plane containing the another axis and the central axis and the

central plane equally into two (Figs. 1A-1C). The table facet has two opposite vertexes on the

central plane and six vertexes symmetrical with respect to the central plane (Figs. 1A-1C). The

crown has eight tetragonal crown main facets (14), eight triangular star facets (15) and sixteen

upper girdle facets (16) on a diamond circumference between the girdle upper ridge and the table

facet. Each of the crown main facets is a tetragon having two opposite vertexes composed of a

point, at which each of the eight-dividing planes crosses the girdle upper ridge and each vertex of

the table facet, and other vertexes each owned jointly with each of two other crown main facets

neighboring on the crown main facet (Fig. 1A). Each of the star facets is a triangle having a

bottom side coinciding with each side of the table facet and an opposite vertex coinciding with

each of the other vertexes jointly owned by two neighboring crown main facets each having a

vertex at each end of the bottom side (Fig. 1A). Each of the upper girdle facets is a triangle or an

oval sector having a bottom side coinciding with a side, whose end is on the girdle upper ridge,

among sides of the crown main facets and a vertex on the girdle upper ridge (Figs. 1A). The

pavilion has a bottom apex (13) at a lower end of the central axis and eight pavilion main facets

(17) and sixteen lower girdle facets (18) on the diamond perimeter between the bottom apex and

the girdle lower ridge (Fig. 1C). Each of the pavilion main facets is a tetragon or a part of a

tetragon extending from the bottom apex toward a crossing point of each of the eight-dividing

planes with the girdle lower ridge on the diamond perimeter between the bottom apex and the

girdle lower ridge, and having a side, whose end coincides with the bottom apex, jointly owned

with each of two other pavilion main facets neighboring on the pavilion main facet (Fig. 1C).

Each of at least seven pavilion main facets among the pavilion main facets is formed with

opposite vertexes composed of a crossing point of each of the eight-dividing planes with the

girdle and the bottom apex (Fig. 1B and 1C). Each of the lower girdle facets formed between the

pavilion main facets and the girdle lower ridge is a triangle or an oval sector having a bottom

side coinciding with a side having an end on the girdle lower ridge among sides of each of the

pavilion main facets and a vertex on the girdle lower ridge (Figs. 1B and 1C). Each of the lower

girdle facets is disposed on each of both sides of each of the pavilion main facets (Figs. 1A and

1C). Each pair of four pairs of pavilion main facets, of which each pair is composed of two

pavilion main facets positioned opposite to each other with respect to the central axis, has two

crown main facets facing the two pavilion main facets through the girdle, and the two pavilion

main facets, the two crown main facets and the table facet have a common plane vertical to all of

them within them (Figs. 1B). The pavilion angle p to the table facet each of the pavilion main

facets has and a crown angle to the table facet each of the crown main facets has are in a region

surrounded by lines connecting points, "p, c", on a graph drawn with pavilion angles ,p, in a

vertical line and crown angles, c, in a horizontal line. The graph serves to show a region of the

pavilion angle p and the crown angle c that enhances the amount of effective visual-perceptible

reflection rays (Paragraph 0074 and 0158). Therefore, it would have been obvious to one having

ordinary skill in the art at time the invention was made to have the pavilion angle p to the table

facet each of the pavilion main facets has and a crown angle to the table facet each of the crown

main facets has are in a region surrounded by lines connecting points, "p, c", on a graph drawn

with pavilion angles ,p, in a vertical line and crown angles, c, in a horizontal line as taught by

Kawabuchi et al. in the diamond disclosed by Itzkowitz and modified by Kedem et al. Doing so,

serves to show a region of the pavilion angle p and the crown angle c that enhances the amount

of effective visual-perceptible reflection rays. With respect to the specific angle that are being

claimed, it would have been obvious to one having ordinary skill in the art at the time the

invention was made to have the points "p, c": (43 degrees, 10 degrees), (41 degrees, 14 degrees),

(37 degrees, 23 degrees), (35 degrees, 33 degrees), (35 degrees, 36 degrees), (37 degrees, 42

degrees), (39 degrees, 42 degrees), (41 degrees, 36 degrees), (43 degrees, 24 degrees) and (44.7

degrees, 9 degrees) on the graph since it is extremely old, well known, readily apparent and

profoundly obvious to change the size, shape, orientation, **angles**, percentages, and create ranges

for facets and the gemstone in its entirely as to merely alter the aesthetics of said gemstone for

the corresponding and resulting properties including brilliance, radiance, etc. for the utility of

mere user preference. It is also extremely well known that altering said features will produce

different properties radiating from said gemstone, depending on the changes and alterations

made. Therein, once again, lies the pertinence behind such, as no unexpected result, viewed by

one skilled in the art; will occur, with any of the above possible changes or alterations to any

given gemstone.

Response to Arguments

[6]   Applicant's amendments and arguments filed 5/14/2009 regarding rejections under 35

U.S.C. 103 have been fully considered but they are not persuasive. In the instant case, the

current examiner of record maintains that the prior art as shown above teaches of the claimed

limitations, and if it is held that they do not, either individually or in combination, the examiner,

further maintains that it would have been obvious to one having ordinary skill in the art at the

time of applicant's invention to have made or have modified the structure of the claimed

gemstone since it is extremely old, well known, readily apparent and profoundly obvious to

change the size, shape, orientation, angles, percentages, planes, and create ranges for facets and

the gemstone in its entirely as to merely alter the aesthetics of said gemstone for the

corresponding and resulting properties including brilliance, radiance, etc. for the utility of mere

user preference. It is also extremely well known that altering said features will produce different

properties radiating from said gemstone, depending on the changes and alterations made.

Therein, once again, lies the pertinence behind such, as no unexpected result, viewed by one

skilled in the art; will occur, with any of the above possible changes or alterations to any given

gemstone.

        Pursuant to KRS, the examiner would like to point out that KSR forecloses the argument

that a specific teaching, suggestion, or motivation is required to support a finding of obviousness.

Ex parte Smith, --USPQ2d--, slip op. at 20, (Bd. Pat. App. & Interf. June 25, 2007). In addition,

it is not required that the prior art disclose or suggest the properties newly-discovered by an

applicant in order for there to be a prima facie case of obviousness. *See In re Dillon, 919 F.2d*

688, 16 USPQ2d 1897, 1905 (Fed. Cir. 1990). Moreover, as long as some motivation or

suggestion to combine the references is <u>provided by the prior art taken as a whole</u>, the law does

not require that the references be combined for the reasons contemplated by the inventor. *See In*

re Beattie, 974 F.2d 1309, 24 USPQ2d 1040 (Fed. Cir. 1992); In re Kronig, 539 F.2d 1300, 190

USPQ 425 (CCPA 1976) and In re Wilder, 429 F.2d 447, 166 USPQ 545 (CCPA 1970). The test

for obviousness is not whether the features of a secondary reference may be bodily incorporated

into the structure of the primary reference; <u>nor is it that the claimed invention must be expressly</u>

<u>suggested in any one or all of the references.</u> Rather, the test is what the combined teachings of

the references would have suggested to those of ordinary skill in the art. *In re Keller, 642 F. 2d*

413, 425, 208 USPQ 871, 881 (CCPA 1981). In this regard, a <u>conclusion of obviousness may be</u>

<u>based on common knowledge and common sense of the person of ordinary skill in the art</u>

<u>without any specific hint or suggestion in a particular reference.</u> *In re Bozek, 416 F .2d 1385,*

1390, 163 USPQ 545, 549 (CCPA 1969).

  The mere existence of differences between the prior art and an invention does not

establish the invention's nonobviousness. The gap between the prior art and respondent's system

is simply not so great as to render the system nonobvious to one reasonably skilled in the art.

Dann Commission of PET V. Johnston 189 USPQ 257.

  Moreover, when there is a <u>design need or market pressure to solve a problem and there</u>

<u>are a finite number of identified, predictable solutions (such as so many ways to cut a gemstone),</u>

a person of ordinary skill has good reason to pursue the known options within his or her

technical grasp. If this leads to the anticipated success, it is likely the product not of innovation

but of ordinary skill and common sense. Ultimately, <u>the determining of obviousness does not</u>

<u>require staying within the object of Itzkowitz or Kedem et al.</u> "The question is not whether the

combination was obvious to the patentee but whether the combination was obvious to a person

with ordinary skill in the *art." KSR Int'l. Co. v. Teleflex Inc.,* 127 S.Ct. 1727, 1742, 82 USPQ2d

1385, 1397 (2007). In making the obviousness determination one "can take account of the

inferences and creative steps that a person of ordinary skill in the art would employ." *KSR,* 127

S.Ct. at 1741, 82 USPQ2d at 1396. "A person of ordinary skill is also a person of ordinary

creativity, not an automaton." *KSR,* 127 S.Ct. at 1742. 82 USPO2d at 1397.

Conclusion

[7]   **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time
policy as set forth in 37 CFR 1.136(a).
      A shortened statutory period for reply to this final action is set to expire THREE
MONTHS from the mailing date of this action. In the event a first reply is filed within TWO
MONTHS of the mailing date of this final action and the advisory action is not mailed until after
the end of the THREE-MONTH shortened statutory period, then the shortened statutory period
will expire on the date the advisory action is mailed, and any extension fee pursuant to 37
CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event,
however, will the statutory period for reply expire later than SIX MONTHS from the mailing
date of this final action.
